SUBJECT: King County Airport Sludge Application Project

I have reviewed the information supplied on this project to determine the appropriate process to meet SEPA requirements.

The DNS's which were completed in 1981 for sludge application at King County Airport specified that the sludge project would be completed in 1982. The project as described in the previous checklist contemplated use of dewatered sludge from the West Point plant with a one-inch application. The current proposal is to use liquid sludge from the Alki plant. As I understand it, use of liquid sludge minimizes odor problems and makes application easier. The sludge application sites are identical to those described in the 1981 checklist.

Based on my review of the 1981 checklists, the impacts of the continuation of this project are substantially the same as were described previously. Therefore, our conclusion is that the 1981 DNS's are adequate to meet SEPA requirements for this project.

If you would like any assistance with SEPA process in obtaining permits for this project, please let me know.
